

JGH INTELLIGENCE ENGINE

BUSINESS EXECUTIVE SCENARIOS SPECIFICATION

Document Version: 3.0	Target System: JGH Enterprise Analytics Platform
Author: Business Strategy & AI Architecture Team	Audience: C-Suite & Operations Leadership
Scope: 10 Executive Business Scenarios	Date: August 12, 2026

EXECUTIVE SUMMARY

The JGH Intelligence Engine transforms complex enterprise data (27,700+ registered mechanics, 6.5M+ transactions, dual-scan supply chain logistics) into actionable business intelligence.

This document presents **10 Core Business-Level Scenarios**, detailing each situation from the **Business Leadership Perspective**, the **Operational Risk Involved**, and the **Business Solution Delivered** by the AI Collaborator platform.

BUSINESS SCENARIOS SPECIFICATION

SCENARIO 1: Quarterly Sales Incentive Campaign Verification

1. Business Context & Question

- **Executive Question:** "Which mechanics qualify for the Q2 Bonus Gold Tier based on verified QR box scans?"
- **Business Goal:** Reward top-performing mechanics and retail shop owners who reached quarterly scan milestones.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** If the system counts unverified wholesaler dispatches, duplicate QR scans, or scans outside the exact Q2 calendar window, the company overpays millions in unearned loyalty bonuses, hurting gross margins.

3. Business Solution Delivered

■ **Business Solution:** The AI automatically verifies dual-scan records (status_retailer_id and retailer_scanned_at within exact Q2 date bounds) against master product reward points (sku_qr_points_maps). It generates a 100% accurate, audit-ready list of eligible mechanics, preventing bonus overpayments.

SCENARIO 2: High-Volume Fraud & Duplicate QR Code Detection

1. Business Context & Question

- **Executive Question:** "Identify accounts exhibiting abnormal scan velocity or duplicate QR code attempts."
- **Business Goal:** Protect corporate loyalty reserves from fraudulent scan activity.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Fraudulent retailers scanning recycled/fake QR codes or logging 500 box scans in 10 minutes can quickly drain corporate reward funds and skew sales volume metrics.

3. Business Solution Delivered

■ **Business Solution:** The AI analyzes scan timestamps and frequency patterns to flag high-velocity accounts instantly. Suspicious accounts are frozen and routed to the Accounts Head (Role 13) for audit review before any payout withdrawal is approved.

SCENARIO 3: Wholesaler Inventory Bottleneck & Regional Supply Delay

1. Business Context & Question

- **Executive Question:** "Why are Kolkata warehouse dispatches down 20% while retailer scan demand in Bihar is rising?"
- **Business Goal:** Eliminate regional inventory bottlenecks and accelerate product movement through wholesale channels.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Wholesalers (Role 5) hoarding inventory without logging dispatch scans creates artificial stockouts in retail markets, leading to missed regional sales opportunities.

3. Business Solution Delivered

■ **Business Solution:** The AI compares wholesaler dispatch timestamps (`wholeseller_scanned_at`) against mechanic scan timestamps (`retailer_scanned_at`) across regional warehouses, pinpointing exact supply chain delays and highlighting underperforming wholesale hubs.

SCENARIO 4: Monthly Cash Payout vs. Bank Liquidity Forecasting

1. Business Context & Question

- **Executive Question:** "What is our projected cash withdrawal payout liability for next Monday's bank transfer run?"
- **Business Goal:** Ensure corporate treasury maintains sufficient liquid funds for seamless mechanic bank transfers.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Underestimating pending withdrawal requests (`withdrawal_request`) leads to failed bank transfers via Payment Gateways (`automatic_transactions`), damaging retailer trust and mechanic loyalty.

3. Business Solution Delivered

■ **Business Solution:** The AI aggregates all approved withdrawal queues, calculates net bank payout liabilities in real time, and alerts the Treasury team prior to executing weekly payment runs.

SCENARIO 5: High-Value Mechanic Retention & Churn Risk Alert

1. Business Context & Question

- **Executive Question:** "Show top 20 mechanics who were active in May and June but stopped scanning in July."
- **Business Goal:** Identify and re-engage declining loyalty accounts before they switch to competitors.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Losing high-volume mechanics reduces repeat product purchases in key sales territories, leading to multi-million rupee revenue losses over time.

3. Business Solution Delivered

■ **Business Solution:** The AI evaluates historical scan frequency cohorts and flags high-value mechanics whose scan activity dropped by >50%. It notifies regional Area Managers (Role 7) to re-engage them with targeted promotional incentives.

SCENARIO 6: Regional Territory Re-Alignment & Commission Attribution

1. Business Context & Question

- **Executive Question:** "Re-assign Bihar sales territory metrics between Area Manager A and Area Manager B."
- **Business Goal:** Ensure fair commission distribution and accurate performance evaluation across regional sales teams.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Overlapping regional territory boundaries cause double-counting of mechanic earnings or disputes over sales commission credits among field managers.

3. Business Solution Delivered

■ **Business Solution:** The AI resolves all retailer and mechanic accounts to exact company business units (companies.business_unit) and state boundaries, ensuring single-attribution reporting and conflict-free commission payouts.

SCENARIO 7: Product Line Profitability & SKU Points Restructuring

1. Business Context & Question

- **Executive Question:** "Which SKU product categories yield the highest scan engagement per cash point distributed?"
- **Business Goal:** Optimize reward point allocations to boost sales of high-margin product lines.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Awarding high reward points on low-margin products reduces overall product line profitability and wastes marketing budget.

3. Business Solution Delivered

■ **Business Solution:** The AI correlates unit scan volumes (sku_inventories) with reward point values (sku_qr_points_maps) across product categories, advising Product Managers on where to increase or decrease cash point values for maximum profitability.

SCENARIO 8: Executive Role Governance & Access Control Audit

1. Business Context & Question

- **Executive Question:** "Audit user roles 1 through 14 to verify proper administrative segregation across regional hubs."
- **Business Goal:** Maintain strict operational governance and organizational accountability.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Role confusion (e.g., Wholesalers operating under Mechanic accounts) compromises supply chain tracking and administrative accountability.

3. Business Solution Delivered

■ **Business Solution:** The AI cross-references all 29,000+ active user accounts against strict role hierarchy rules (Roles 1-14 defined in onboarding_docs.json), flagging role misconfigurations for instant HR and IT correction.

SCENARIO 9: Seasonal Demand Spikes & Warehouse Stock Allocation

1. Business Context & Question

- **Executive Question:** "Predict buffer stock required for the Kolkata warehouse facility ahead of the upcoming festive season."
- **Business Goal:** Prevent product shortages during peak seasonal demand periods.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Under-stocking the primary Kolkata warehouse facility during peak festive months causes stockouts across 5 neighboring distribution states.

3. Business Solution Delivered

■ **Business Solution:** The AI analyzes prior year monthly scan trends and inventory velocity to calculate exact buffer stock requirements, guiding Warehouse Managers (Role 10) on stock replenishment schedules.

SCENARIO 10: Executive Board Review & Zero-Trace Privacy Mode

1. Business Context & Question

- **Executive Question:** `""Run confidential profitability analysis on distributor compensation during a live Board meeting.""`
- **Business Goal:** Access sensitive executive metrics during high-level strategic reviews without leaking corporate data.

2. Operational Risk (What Could Go Wrong)

- **The Risk:** Storing sensitive distributor earnings or executive compensation queries in local disk audit logs risks data leaks or compliance violations.

3. Business Solution Delivered

■ **Business Solution:** The executive toggles **Incognito Privacy Mode** (`is_private: true`). The AI processes the query strictly in volatile RAM, suppressing disk logging and wiping memory buffers immediately after presenting results on screen.

BUSINESS VALUE & IMPACT MATRIX

BUSINESS VALUE & IMPACT MATRIX

Scenario #	Business Focus Area	Target Executive	Key Business Impact Delivered
Scenario 1	Sales Incentives	VP of Sales	Prevents overpayment of unearned loyalty bonuses
Scenario 2	Fraud Prevention	Head of Internal Audit	Protects reward reserves from fake/recycled QR scans
Scenario 3	Supply Chain Velocity	Director of Supply Chain	Eliminates regional bottlenecks & wholesaler hoarding
Scenario 4	Treasury & Liquidity	CFO & Treasury	Forecasts weekly bank payout liabilities to avoid failures
Scenario 5	Mechanic Retention	Customer Success Lead	Identifies churning mechanics for targeted re-engagement
Scenario 6	Territory Governance	Regional Sales Directors	Ensures conflict-free commission attribution & single truth
Scenario 7	SKU Margin Optimization	Product Managers	Restructures point values to boost high-margin sales
Scenario 8	Operational Governance	HR & IT Operations	Audits Roles 1-14 to enforce administrative accountability
Scenario 9	Inventory Planning	Kolkata Warehouse Lead	Predicts seasonal stock buffer needs across 5 states
Scenario 10	Executive Privacy	Board of Directors / CEO	Zero-disk trace execution for confidential board reviews
