

JGH Database: Table-Wise Dropdowns Catalog

A consolidated mapping of enums and statuses, grouped by database table.

This catalog groups every dropdown-like column (including enums, statuses, workflow tags, and category types) by its parent table. For each table, the total number of dropdown columns is stated, followed by detailed breakdowns of each column's SQL types, comments, stored options, and business logic behaviors.

■ Table: activate_qrs_requests [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 0:pending,1:completed. System categorical configuration field defining the 'status' setting for the 'activate_qrs_requests' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'activate_qrs_requests' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1

■ Table: addresses [Contains 1 Dropdown Column(s)]

→ Column: address_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'address_type' setting for the 'addresses' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'addresses' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'address_type' values.
- **Stored Values / Dropdown Options:** Home, Work, Other

■ Table: app_link_report [Contains 1 Dropdown Column(s)]

→ Column: source

- **SQL Type:** int
- **What is it?** 1:qr , 2:whatsapp,3: 3:marketing, 4: phonepe, 5:print_ad. System categorical configuration field defining the 'source' setting for the 'app_link_report' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'app_link_report' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'source' values.
- **Stored Values / Dropdown Options:** 2, 15, 4

■ Table: automatic_transactions [Contains 3 Dropdown Column(s)]

→ Column: status

- **SQL Type:** varchar(255)
- **What is it?** Payout API Transaction State
- **Where does it come from? (Trigger):** Automatically populated via webhooks and API responses from the payment provider gateway (Cashfree/Razorpay).
- **What is its use / Business Value?** Determines if payout funds successfully cleared or failed.
- **Individual Value Options Breakdown:**

→ Value: success

What is it? Funds successfully credited to the user's bank account.

Where does it come from? Successful execution response webhook from the payment API.

What is its use? Sets the corresponding withdrawal_request.status to approved/completed, marking the transaction as final.

→ Value: failed / faled

What is it? Funds transfer rejected or failed (e.g. invalid account/IFSC, insufficient gateway balance). Note: 'faled' is a legacy vendor typo stored in the DB.

Where does it come from? Failure callback payload from the bank payout gateway.

What is its use? Flags the payout transaction for accountant review, indicating the funds were not deducted and require retrying.

→ Value: pending

What is it? Payout is currently in transit at the bank.

Where does it come from? Initial payout request confirmation payload from the provider API.

What is its use? Locks the request to prevent duplicate payout API calls while waiting for the final bank status.

→ Value: rejected

What is it? Payout blocked by the gateway's risk validation or fraud checks.

Where does it come from? Gateway provider verification engine.

What is its use? Requires manual compliance review by JGH admins.

→ Column: transaction_source

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'transaction_source' setting for the 'automatic_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'automatic_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_source' values.
- **Stored Values / Dropdown Options:** cashfree

→ Column: transfer_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'transfer_type' setting for the 'automatic_transactions' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'automatic_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transfer_type' values.
- **Stored Values / Dropdown Options:** IMPS, failed, Manual, Manual_success

■ Table: bank_accounts [Contains 1 Dropdown Column(s)]

→ Column: bank_account_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'bank_account_type' setting for the 'bank_accounts' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'bank_accounts' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'bank_account_type' values.
- **Stored Values / Dropdown Options:** Savings, Current

■ Table: bank_transactions [Contains 4 Dropdown Column(s)]

→ Column: moneyTransferStatus

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'moneyTransferStatus' setting for the 'bank_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'bank_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'moneyTransferStatus' values.
- **Stored Values / Dropdown Options:** SUCCESS, FAILURE

→ Column: transactionType

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'transactionType' setting for the 'bank_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'bank_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transactionType' values.
- **Stored Values / Dropdown Options:** MAIN REVERSAL, MAIN

→ Column: transferType

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'transferType' setting for the 'bank_transactions' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'bank_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transferType' values.
- **Stored Values / Dropdown Options:** IMPS, NEFT

→ Column: type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'type' setting for the 'bank_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'bank_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** CREDIT, DEBIT

■ Table: beat_plans [Contains 2 Dropdown Column(s)]

→ Column: frequency

- **SQL Type:** enum('daily','weekly','biweekly','monthly')
- **What is it?** Number of times SE must visit the assigned retailers in a timespan. System categorical configuration field defining the 'frequency' setting for the 'beat_plans' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'beat_plans' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'frequency' values.
- **Stored Values / Dropdown Options:** daily, weekly, biweekly, monthly

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 1 for active, 0 for inactive. System categorical configuration field defining the 'status' setting for the 'beat_plans' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'beat_plans' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** -

■ Table: blacklist_reports [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** int
- **What is it?** 1 : blacklist, 2 :whitelist. System categorical configuration field defining the 'status' setting for the 'blacklist_reports' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'blacklist_reports' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 2

■ Table: bonus_transactions [Contains 2 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('gift_order','cash_point','coupon_redeem','incentive','credit_note')
- **What is it?** Bonus Points Credit/Debit Source Category
- **Where does it come from? (Trigger):** Logged during bonus point additions or gift order transactions.
- **What is its use / Business Value?** Categorizes the source of the user's bonus point balances.
- **Individual Value Options Breakdown:**

→ Value: gift_order

What is it? Bonus points deducted to redeem a gift catalog item.

Where does it come from? User redeems a gift in the app.

What is its use? Deducts points from the bonus balance.

→ Value: cash_point

What is it? Points credited from standard scanning activities.

Where does it come from? Barcoded box scan rewards.

What is its use? Increments the user's bonus point ledger.

→ Value: coupon_redeem

What is it? Points credited from a redeemed scratch coupon code.

Where does it come from? Manual coupon input in the app.

What is its use? Credits coupon-based bonus points.

→ Value: incentive

What is it? Bonus points credited from campaign performance.

Where does it come from? Growth schemes and milestone targets.

What is its use? Credits scheme-based bonus points.

→ Value: credit_note

What is it? Bonus points adjusted via CN settlements.

Where does it come from? Distributor credit note workflow.

What is its use? Adjusts bonus points balances.

→ Column: type

- **SQL Type:** enum('credit','debit')
- **What is it?** Bonus Points Flow Polar Flag
- **Where does it come from? (Trigger):** Created automatically on bonus points movements.
- **What is its use / Business Value?** Determines whether bonus points are added or subtracted.
- **Individual Value Options Breakdown:**

→ Value: credit

What is it? Points added to the user's bonus points balance.

Where does it come from? Campaign awards, scan bonuses, or coupon redemptions.

What is its use? Increases active bonus balance.

→ Value: debit

What is it? Points subtracted from the user's bonus points balance.

Where does it come from? Gift catalog orders or points clawbacks.

What is its use? Decreases active bonus balance.

■ Table: box_gift_orders [Contains 2 Dropdown Column(s)]**→ Column: assigned_type**

- **SQL Type:** tinyint
- **What is it?** 0-> distributor , 1->other. System categorical configuration field defining the 'assigned_type' setting for the 'box_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'box_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'assigned_type' values.
- **Stored Values / Dropdown Options:** 0

→ Column: status

- **SQL Type:** enum('Pending','Processing','Delivered','Cancelled','Closed','CN adjusted')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'box_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'box_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** Pending, Processing, Delivered, Cancelled, Closed, CN adjusted

■ Table: branding_elements [Contains 2 Dropdown Column(s)]**→ Column: status**

- **SQL Type:** tinyint
- **What is it?** 1=active, 0=inactive. System categorical configuration field defining the 'status' setting for the 'branding_elements' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'branding_elements' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0, 1

→ Column: type

- **SQL Type:** enum('printed','digital','other')
- **What is it?** System categorical configuration field defining the 'type' setting for the 'branding_elements' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'branding_elements' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** printed, digital, other

■ Table: branding_requests [Contains 2 Dropdown Column(s)]**→ Column: payment_status**

- **SQL Type:** tinyint
- **What is it?** 0 = Unpaid, 1 = Paid, 2 = On-Hold, 3 = Initiated. System categorical configuration field defining the 'payment_status' setting for the 'branding_requests' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'branding_requests' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'payment_status' values.
- **Stored Values / Dropdown Options:** 0

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 0-> pending request; 1-> approved request ; 2-> survey completed ; 3-> estimate approvals ; 4 -> installation done ; 5-> rejected. System categorical configuration field defining the 'status' setting for the 'branding_requests' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'branding_requests' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0, 5

■ Table: brands [Contains 1 Dropdown Column(s)]**→ Column: status**

- **SQL Type:** enum('1','0')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'brands' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'brands' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: bulk_reports [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 0:pending,1:started,2:completed,3:cancelled. System categorical configuration field defining the 'status' setting for the 'bulk_reports' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'bulk_reports' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 2, 3

■ Table: campaign_logs [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'status' setting for the 'campaign_logs' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'campaign_logs' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** failed, success, skipped, read

■ Table: cart_items [Contains 1 Dropdown Column(s)]

→ Column: product_type

- **SQL Type:** enum('core','winter')
- **What is it?** System categorical configuration field defining the 'product_type' setting for the 'cart_items' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'cart_items' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'product_type' values.
- **Stored Values / Dropdown Options:** core, winter

■ Table: category_sub_group_master_category_mapping [Contains 2 Dropdown Column(s)]

→ Column: category_sub_group_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'category_sub_group_id' setting for the 'category_sub_group_master_category_mapping' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'category_sub_group_master_category_mapping' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_sub_group_id' values.
- **Stored Values / Dropdown Options:** 1, 2, 3, 7, 5, 4, 6, 15, 24, 26 ... (and more)

→ Column: master_category_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'master_category_id' setting for the 'category_sub_group_master_category_mapping' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'category_sub_group_master_category_mapping' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'master_category_id' values.
- **Stored Values / Dropdown Options:** 440, 441, 442, 443, 444, 445, 446, 447, 448, 449 ... (and more)

■ Table: claimed_offers [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** enum('pending','completed','rejected')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'claimed_offers' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'claimed_offers' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** pending, completed, rejected

■ Table: conference_events [Contains 5 Dropdown Column(s)]

→ Column: category_conversion_rate

- **SQL Type:** json
- **What is it?** System categorical configuration field defining the 'category_conversion_rate' setting for the 'conference_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'conference_events' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_conversion_rate' values.
- **Stored Values / Dropdown Options:** [{"category_id": 8, "category_name": "COMFY LADIES", "conversion_rate": "70"}, {"category_id": 9, "category_name": "COMFY Vest", "conversion_rate": "80"}, {"category_id": 10, "category_name": "COMFY TRUNKS & BRIEFS", "conversion_rate": "60"}, {"category_id": 11, "category_name": "COMFY GYM VEST", "conversion_rate": "50"}, {"category_id": 17, "category_name": "MCH/SPT BRIEFS & MT", "conversion_rate": "75"}, {"category_id": 18, "category_name": "MCH/SPT FINE & DERBY VEST", "conversion_rate": "70"}, {"category_id": 19, "category_name": "MCH/SPT LONG & FCD", "conversion_rate": "64"}, {"category_id": 20, "category_name": "MCH/SPT PARKA", "conversion_rate": "64"}, {"category_id": 21, "category_name": "SPORTO NEO"}]

SERIES", "conversion_rate": "50"}, {"category_id": 24, "category_name": "SPORTO GYM VEST", "conversion_rate": "34"}, {"category_id": 25, "category_name": "SPORTO MARVEL KIDS", "conversion_rate": "45"}], [{"category_id": 12, "category_name": "NEW COMFY ATHELIX POLO TEE", "conversion_rate": "35"}, {"category_id": 13, "category_name": "NEW- COMFY ATHELIX RN TEE", "conversion_rate": "35"}, {"category_id": 14, "category_name": "NEW- COMFY ATHELIX SHORTS", "conversion_rate": "35"}, {"category_id": 15, "category_name": "NEW- COMFY ATHELIX TRACKS", "conversion_rate": "35"}, {"category_id": 16, "category_name": "NEW- COMFY ATHELIX MEGA VEST", "conversion_rate": "35"}, {"category_id": 22, "category_name": "NEW- SPORTO NEO MODAL VEST", "conversion_rate": "50"}, {"category_id": 23, "category_name": "NEW- SPORTO NEO MODAL TRUNKS", "conversion_rate": "50"}, {"category_id": 26, "category_name": "NEW-COMFY CASUAL PRINT BERMUDAS", "conversion_rate": "30"}, {"category_id": 27, "category_name": "NEW-COMFY CASUAL PLAIN SHORTS", "conversion_rate": "30"}, {"category_id": 28, "category_name": "NEW-COMFY CASUAL RN TEE", "conversion_rate": "30"}, {"category_id": 29, "category_name": "NEW-COMFY CASUAL POLO TEE", "conversion_rate": "30"}, {"category_id": 30, "category_name": "NEW-COMFY CASUAL TRACKS & JOGGERS", "conversion_rate": "30"}]

→ Column: order_type

- **SQL Type:** enum('all','core','winter')
- **What is it?** System categorical configuration field defining the 'order_type' setting for the 'conference_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'conference_events' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_type' values.
- **Stored Values / Dropdown Options:** all, core, winter

→ Column: order_unit

- **SQL Type:** enum('all','box','carton','pcs')
- **What is it?** System categorical configuration field defining the 'order_unit' setting for the 'conference_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'conference_events' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_unit' values.
- **Stored Values / Dropdown Options:** all, box, carton, pcs

→ Column: status

- **SQL Type:** tinyint(1)
- **What is it?** 1:active, 0:inactive. System categorical configuration field defining the 'status' setting for the 'conference_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'conference_events' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0

→ Column: user_type

- **SQL Type:** bigint unsigned
- **What is it?** 5:Wholesaler, 2:Retailer,4:Distributor. System categorical configuration field defining the 'user_type' setting for the 'conference_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'conference_events' module.

- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_type' values.
- **Stored Values / Dropdown Options:** 4

■ Table: coupon_transactions [Contains 1 Dropdown Column(s)]

→ Column: type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'type' setting for the 'coupon_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'coupon_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** credit

■ Table: coupons [Contains 3 Dropdown Column(s)]

→ Column: business_type

- **SQL Type:** tinyint
- **What is it?** 1 = Retailer, 2 = Wholesaler, 3 = Distributor. System categorical configuration field defining the 'business_type' setting for the 'coupons' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'coupons' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'business_type' values.
- **Stored Values / Dropdown Options:** 2

→ Column: coupon_status

- **SQL Type:** tinyint
- **What is it?** 1 = Active, 2 = Redeemed, 3 = Expired, 4 = Cancelled. System categorical configuration field defining the 'coupon_status' setting for the 'coupons' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'coupons' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'coupon_status' values.
- **Stored Values / Dropdown Options:** 3

→ Column: coupon_type

- **SQL Type:** tinyint
- **What is it?** 1 = cash point, 2 = bonus point. System categorical configuration field defining the 'coupon_type' setting for the 'coupons' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'coupons' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'coupon_type' values.

- **Stored Values / Dropdown Options:** 1

■ Table: credit_notes [Contains 1 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('cash_wallet','deactivated_qr_wallet')
- **What is it?** System categorical configuration field defining the 'reference_type' setting for the 'credit_notes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'credit_notes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'reference_type' values.
- **Stored Values / Dropdown Options:** cash_wallet, deactivated_qr_wallet

■ Table: dashboard_daily_data [Contains 1 Dropdown Column(s)]

→ Column: user_type

- **SQL Type:** int
- **What is it?** System categorical configuration field defining the 'user_type' setting for the 'dashboard_daily_data' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'dashboard_daily_data' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_type' values.
- **Stored Values / Dropdown Options:** 2, 5, 4, 25

■ Table: deactivated_qr_wallet_transactions [Contains 2 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('sku_scan','topup','credit_note')
- **What is it?** System categorical configuration field defining the 'reference_type' setting for the 'deactivated_qr_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'deactivated_qr_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'reference_type' values.
- **Stored Values / Dropdown Options:** sku_scan, topup, credit_note

→ Column: transaction_type

- **SQL Type:** tinyint
- **What is it?** 0:debit,1:credit. System categorical configuration field defining the 'transaction_type' setting for the 'deactivated_qr_wallet_transactions' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'deactivated_qr_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_type' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: districts [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** tinyint(1)
- **What is it?** 1:active, 0:inactive. System categorical configuration field defining the 'status' setting for the 'districts' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'districts' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: engagement_event_conditions [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** enum('active','inactive')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'engagement_event_conditions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'engagement_event_conditions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** active, inactive

■ Table: engagement_events [Contains 2 Dropdown Column(s)]

→ Column: recurrence_type

- **SQL Type:** enum('none','daily','weekly','monthly','yearly')
- **What is it?** System categorical configuration field defining the 'recurrence_type' setting for the 'engagement_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'engagement_events' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'recurrence_type' values.
- **Stored Values / Dropdown Options:** none, daily, weekly, monthly, yearly

→ Column: status

- **SQL Type:** enum('active','inactive','expired')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'engagement_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'engagement_events' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** active, inactive, expired

■ Table: engagement_reward_masters [Contains 1 Dropdown Column(s)]**→ Column: status**

- **SQL Type:** enum('active','inactive')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'engagement_reward_masters' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'engagement_reward_masters' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** active, inactive

■ Table: event_orders [Contains 3 Dropdown Column(s)]**→ Column: category_id**

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'category_id' setting for the 'event_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'event_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_id' values.
- **Stored Values / Dropdown Options:** 8, 9, 11, 10, 17, 18, 19, 20, 21, 24 ... (and more)

→ Column: order_status

- **SQL Type:** varchar(255)
- **What is it?** 0:pending, 1:approved, 2:rejected, 3:completed, 4:cancelled. System categorical configuration field defining the 'order_status' setting for the 'event_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'event_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_status' values.
- **Stored Values / Dropdown Options:** 0

→ Column: order_type

- **SQL Type:** enum('box','carton','pcs')
- **What is it?** System categorical configuration field defining the 'order_type' setting for the 'event_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'event_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_type' values.
- **Stored Values / Dropdown Options:** box, carton, pcs

■ Table: executive_survey_forms [Contains 1 Dropdown Column(s)]**→ Column: answer_type**

- **SQL Type:** enum('numeric','text','image')
- **What is it?** System categorical configuration field defining the 'answer_type' setting for the 'executive_survey_forms' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'executive_survey_forms' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'answer_type' values.
- **Stored Values / Dropdown Options:** numeric, text, image

■ Table: failed_skus_callback_csvs [Contains 1 Dropdown Column(s)]**→ Column: source**

- **SQL Type:** tinyint(1)
- **What is it?** 1: kolkata, 2 : tirupur. System categorical configuration field defining the 'source' setting for the 'failed_skus_callback_csvs' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'failed_skus_callback_csvs' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'source' values.
- **Stored Values / Dropdown Options:** 1

■ Table: feedback_forms [Contains 1 Dropdown Column(s)]**→ Column: status**

- **SQL Type:** tinyint(1)
- **What is it?** 1:Active, 0:Inactive. System categorical configuration field defining the 'status' setting for the 'feedback_forms' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'feedback_forms' module.

- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** -

■ Table: gift_cards [Contains 4 Dropdown Column(s)]

→ Column: gift_category_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'gift_category_id' setting for the 'gift_cards' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_cards' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gift_category_id' values.
- **Stored Values / Dropdown Options:** 1, 12, 13, 14, 15, 16, 18

→ Column: gift_type

- **SQL Type:** enum('points','box')
- **What is it?** System categorical configuration field defining the 'gift_type' setting for the 'gift_cards' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_cards' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gift_type' values.
- **Stored Values / Dropdown Options:** points, box

→ Column: points_applicability

- **SQL Type:** enum('all','date_range')
- **What is it?** System categorical configuration field defining the 'points_applicability' setting for the 'gift_cards' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_cards' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'points_applicability' values.
- **Stored Values / Dropdown Options:** all, date_range

→ Column: status

- **SQL Type:** tinyint
- **What is it?** System categorical configuration field defining the 'status' setting for the 'gift_cards' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_cards' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: gift_inventories [Contains 2 Dropdown Column(s)]

→ Column: gift_order_type

- **SQL Type:** enum('gift_orders','box_gift_orders','scheme_gift_orders','winter_gift_orders')
- **What is it?** System categorical configuration field defining the 'gift_order_type' setting for the 'gift_inventories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_inventories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gift_order_type' values.
- **Stored Values / Dropdown Options:** gift_orders, box_gift_orders, scheme_gift_orders, winter_gift_orders

→ Column: status

- **SQL Type:** tinyint
- **What is it?** System categorical configuration field defining the 'status' setting for the 'gift_inventories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_inventories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0, 1, 2, 3

■ Table: gift_order_timelines [Contains 1 Dropdown Column(s)]**→ Column: order_type**

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'order_type' setting for the 'gift_order_timelines' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_order_timelines' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_type' values.
- **Stored Values / Dropdown Options:** gift_order, box_gift_order, scheme_gift_order, box_gift_orders, scheme_order, box_order

■ Table: gift_orders [Contains 3 Dropdown Column(s)]**→ Column: assigned_type**

- **SQL Type:** tinyint
- **What is it?** 0-> distributor , 1->other. System categorical configuration field defining the 'assigned_type' setting for the 'gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'assigned_type' values.
- **Stored Values / Dropdown Options:** 0

→ Column: point_type

- **SQL Type:** enum('cash_point','bonus_point')
- **What is it?** System categorical configuration field defining the 'point_type' setting for the 'gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'point_type' values.
- **Stored Values / Dropdown Options:** cash_point, bonus_point

→ Column: status

- **SQL Type:** text
- **What is it?** Pending Processing Delivered Cancel Request Sent Cancellation not Possible Cancelled CN adjusted. System categorical configuration field defining the 'status' setting for the 'gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** Delivered, Pending, Cancelled, CN adjusted, Processing, Closed

■ Table: gift_products [Contains 1 Dropdown Column(s)]

→ Column: gift_category_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'gift_category_id' setting for the 'gift_products' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_products' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gift_category_id' values.
- **Stored Values / Dropdown Options:** 12, 13, 15, 18

■ Table: gift_scan_wallet_transactions [Contains 2 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('sku_scan','gift_order','topup','credit_note','incentive','cash_convert')
- **What is it?** System categorical configuration field defining the 'reference_type' setting for the 'gift_scan_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_scan_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'reference_type' values.
- **Stored Values / Dropdown Options:** sku_scan, gift_order, topup, credit_note, incentive, cash_convert

→ Column: transaction_type

- **SQL Type:** tinyint
- **What is it?** 0:debit,1:credit. System categorical configuration field defining the 'transaction_type' setting for the 'gift_scan_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'gift_scan_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_type' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: greeting_templates [Contains 1 Dropdown Column(s)]**→ Column: status**

- **SQL Type:** tinyint(1)
- **What is it?** 1:active, 0:inactive. System categorical configuration field defining the 'status' setting for the 'greeting_templates' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'greeting_templates' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1

■ Table: home_banner [Contains 1 Dropdown Column(s)]**→ Column: redirect_to_type**

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'redirect_to_type' setting for the 'home_banner' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'home_banner' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'redirect_to_type' values.
- **Stored Values / Dropdown Options:** type_option, file_upload, redirect_link

■ Table: incentive_gift_orders [Contains 3 Dropdown Column(s)]**→ Column: assigned_type**

- **SQL Type:** tinyint
- **What is it?** 0-> distributor , 1->other. System categorical configuration field defining the 'assigned_type' setting for the 'incentive_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_gift_orders' module.

- **What is its use / Business Value?** Used to track and filter table rows based on their 'assigned_type' values.
- **Stored Values / Dropdown Options:** -

→ Column: point_type

- **SQL Type:** enum('cash_point','bonus_point')
- **What is it?** System categorical configuration field defining the 'point_type' setting for the 'incentive_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'point_type' values.
- **Stored Values / Dropdown Options:** cash_point, bonus_point

→ Column: status

- **SQL Type:** text
- **What is it?** Pending Processing Delivered Cancel Request Sent Cancellation not Possible Cancelled CN adjusted. System categorical configuration field defining the 'status' setting for the 'incentive_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** -

■ Table: incentive_schemes [Contains 9 Dropdown Column(s)]

→ Column: additional_monthly_bonus

- **SQL Type:** enum('0','1')
- **What is it?** active=1,inactive=0. System categorical configuration field defining the 'additional_monthly_bonus' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'additional_monthly_bonus' values.
- **Stored Values / Dropdown Options:** 0, 1

→ Column: category_id

- **SQL Type:** json
- **What is it?** System categorical configuration field defining the 'category_id' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_id' values.
- **Stored Values / Dropdown Options:** null

→ Column: incentive_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'incentive_type' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'incentive_type' values.
- **Stored Values / Dropdown Options:** Growth Scheme for Retailer's Monthly Average between 5-24 Boxes, Growth scheme for Retailers who's monthly average scan is equal to or more than 25 Units, June Growth Scheme, CHAMP, PRO, ELITE, SILVER, GOLD, DIAMOND

→ Column: min_scan_type

- **SQL Type:** varchar(255)
- **What is it?** percentage or fixed. System categorical configuration field defining the 'min_scan_type' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'min_scan_type' values.
- **Stored Values / Dropdown Options:** fixed, percentage

→ Column: reward_type

- **SQL Type:** enum('cash','bonus','cash_bonus','gift')
- **What is it?** System categorical configuration field defining the 'reward_type' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'reward_type' values.
- **Stored Values / Dropdown Options:** cash, bonus, cash_bonus, gift

→ Column: status

- **SQL Type:** tinyint(1)
- **What is it?** 0=inactive,1=active,2=expired. System categorical configuration field defining the 'status' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0, 1

→ Column: type

- **SQL Type:** enum('customized_scheme','monthly','monthly_average')
- **What is it?** System categorical configuration field defining the 'type' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.

- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** customized_scheme, monthly, monthly_average

→ Column: user_type

- **SQL Type:** int
- **What is it?** System categorical configuration field defining the 'user_type' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_type' values.
- **Stored Values / Dropdown Options:** 2

→ Column: value_type

- **SQL Type:** enum('fixed','perScan','gift')
- **What is it?** System categorical configuration field defining the 'value_type' setting for the 'incentive_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'incentive_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'value_type' values.
- **Stored Values / Dropdown Options:** fixed, perScan, gift

■ Table: inventory [Contains 2 Dropdown Column(s)]

→ Column: print_status

- **SQL Type:** int
- **What is it?** unprint="0", print="1". System categorical configuration field defining the 'print_status' setting for the 'inventory' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'inventory' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'print_status' values.
- **Stored Values / Dropdown Options:** 0

→ Column: status

- **SQL Type:** int
- **What is it?** qrcode successfully used=1, qrcode not used=0. System categorical configuration field defining the 'status' setting for the 'inventory' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'inventory' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0

■ Table: manual_transactions [Contains 4 Dropdown Column(s)]

→ Column: transaction_source

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'transaction_source' setting for the 'manual_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'manual_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_source' values.
- **Stored Values / Dropdown Options:** manual_upload

→ Column: transactionType

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'transactionType' setting for the 'manual_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'manual_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transactionType' values.
- **Stored Values / Dropdown Options:** PAYOUT

→ Column: transferType

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'transferType' setting for the 'manual_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'manual_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transferType' values.
- **Stored Values / Dropdown Options:** Manual

→ Column: type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'type' setting for the 'manual_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'manual_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** withdrawal

■ Table: master_categories [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** enum('1','0')

- **What is it?** draft ='0', public='1'. System categorical configuration field defining the 'status' setting for the 'master_categories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'master_categories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: mechanic_account_types [Contains 1 Dropdown Column(s)]

→ Column: type_name

- **SQL Type:** text
- **What is it?** System categorical configuration field defining the 'type_name' setting for the 'mechanic_account_types' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mechanic_account_types' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type_name' values.
- **Stored Values / Dropdown Options:** Mechanic

■ Table: mechanic_details [Contains 2 Dropdown Column(s)]

→ Column: firm_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'firm_type' setting for the 'mechanic_details' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mechanic_details' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'firm_type' values.
- **Stored Values / Dropdown Options:** Sole Proprietorship, Partnership, Select Business Type, Private Limited Company (Pvt. Ltd.), Limited Liability Partnership (LLP), CORE, Limited Liability Partnership (LLP)

→ Column: mechanic_account_type

- **SQL Type:** text
- **What is it?** System categorical configuration field defining the 'mechanic_account_type' setting for the 'mechanic_details' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mechanic_details' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'mechanic_account_type' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: mom_thread_participants [Contains 1 Dropdown Column(s)]

→ Column: user_type

- **SQL Type:** enum('SE','ASM','RSM','ZSM','Retailer','Distributor','Wholesaler')
- **What is it?** System categorical configuration field defining the 'user_type' setting for the 'mom_thread_participants' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mom_thread_participants' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_type' values.
- **Stored Values / Dropdown Options:** SE, ASM, RSM, ZSM, Retailer, Distributor, Wholesaler

■ Table: mom_threads [Contains 3 Dropdown Column(s)]

→ Column: entity_type

- **SQL Type:** tinyint
- **What is it?** System categorical configuration field defining the 'entity_type' setting for the 'mom_threads' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mom_threads' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'entity_type' values.
- **Stored Values / Dropdown Options:** 2, 5, 4, 0

→ Column: isVisitModule

- **SQL Type:** enum('0','1')
- **What is it?** System categorical configuration field defining the 'isVisitModule' setting for the 'mom_threads' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mom_threads' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'isVisitModule' values.
- **Stored Values / Dropdown Options:** 0, 1

→ Column: status

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'status' setting for the 'mom_threads' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mom_threads' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** open

■ Table: mypoints [Contains 3 Dropdown Column(s)]

→ Column: migration_status

- **SQL Type:** tinyint(1)
- **What is it?** System categorical configuration field defining the 'migration_status' setting for the 'mypoints' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mypoints' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'migration_status' values.
- **Stored Values / Dropdown Options:** 0

→ Column: point_type

- **SQL Type:** tinyint
- **What is it?** 1:success_scan, 2:return, 3:misused_reset. System categorical configuration field defining the 'point_type' setting for the 'mypoints' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mypoints' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'point_type' values.
- **Stored Values / Dropdown Options:** 1, 2

→ Column: user_role

- **SQL Type:** int
- **What is it?** 2=retailer , 4=distributor, 5=wholesaler. System categorical configuration field defining the 'user_role' setting for the 'mypoints' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'mypoints' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_role' values.
- **Stored Values / Dropdown Options:** 2, 5, 4

■ Table: notification_events [Contains 1 Dropdown Column(s)]**→ Column: status**

- **SQL Type:** tinyint(1)
- **What is it?** 1:Active 0:Inactive. System categorical configuration field defining the 'status' setting for the 'notification_events' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'notification_events' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1

■ Table: notification_logs [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** enum('pending','success','failed','skipped')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'notification_logs' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'notification_logs' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** pending, success, failed, skipped

■ Table: notifications [Contains 3 Dropdown Column(s)]**→ Column: notification_type**

- **SQL Type:** enum('General','Sticky','Alert')
- **What is it?** System categorical configuration field defining the 'notification_type' setting for the 'notifications' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'notifications' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'notification_type' values.
- **Stored Values / Dropdown Options:** General, Sticky, Alert

→ Column: status

- **SQL Type:** tinyint(1)
- **What is it?** 1: Read, 0: Not Read. System categorical configuration field defining the 'status' setting for the 'notifications' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'notifications' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 0

→ Column: user_type

- **SQL Type:** enum('All','Distributor','Retailer','Wholesaler','Executive','Vender')
- **What is it?** System categorical configuration field defining the 'user_type' setting for the 'notifications' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'notifications' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_type' values.
- **Stored Values / Dropdown Options:** All, Distributor, Retailer, Wholesaler, Executive, Vender

■ Table: offer [Contains 1 Dropdown Column(s)]**→ Column: user_role**

- **SQL Type:** int unsigned

- **What is it?** System categorical configuration field defining the 'user_role' setting for the 'offer' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'offer' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_role' values.
- **Stored Values / Dropdown Options:** 5

■ Table: order_bulk_mapping [Contains 1 Dropdown Column(s)]

→ Column: order_type

- **SQL Type:** tinyint
- **What is it?** 1 = Gift Orders, 2 = Box gift orders, 3= scheme gift order , 4 = Winter gift orders. System categorical configuration field defining the 'order_type' setting for the 'order_bulk_mapping' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'order_bulk_mapping' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_type' values.
- **Stored Values / Dropdown Options:** 1, 2, 3

■ Table: order_categories [Contains 3 Dropdown Column(s)]

→ Column: category_name

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'category_name' setting for the 'order_categories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'order_categories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_name' values.
- **Stored Values / Dropdown Options:** Colour Premium, Hot Coat, Kashmira, MAGMA, Parka, launch category, COMFY LADIES, COMFY Vest, COMFY TRUNKS & BRIEFS, COMFY GYM VEST ... (and more)

→ Column: category_type

- **SQL Type:** enum('winter','core')
- **What is it?** System categorical configuration field defining the 'category_type' setting for the 'order_categories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'order_categories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_type' values.
- **Stored Values / Dropdown Options:** winter, core

→ Column: status

- **SQL Type:** tinyint

- **What is it?** System categorical configuration field defining the 'status' setting for the 'order_categories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'order_categories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: orders [Contains 3 Dropdown Column(s)]

→ Column: order_status

- **SQL Type:** tinyint
- **What is it?** 0:pending,1:approved,2:rejected,3:completed,4:cancelled,5: partially-fulfilled,6: fulfilled. System categorical configuration field defining the 'order_status' setting for the 'orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_status' values.
- **Stored Values / Dropdown Options:** 4, 0, 3

→ Column: order_type

- **SQL Type:** enum('by_call','by_visit')
- **What is it?** System categorical configuration field defining the 'order_type' setting for the 'orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_type' values.
- **Stored Values / Dropdown Options:** by_call, by_visit

→ Column: product_type

- **SQL Type:** enum('core','winter')
- **What is it?** System categorical configuration field defining the 'product_type' setting for the 'orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'product_type' values.
- **Stored Values / Dropdown Options:** core, winter

■ Table: otp [Contains 1 Dropdown Column(s)]

→ Column: user_role

- **SQL Type:** int
- **What is it?** User role at time of verifying otp. System categorical configuration field defining the 'user_role' setting for the 'otp' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'otp' module.

- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_role' values.
- **Stored Values / Dropdown Options:** 2, 5, 4

■ Table: packages [Contains 1 Dropdown Column(s)]

→ Column: plan_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'plan_type' setting for the 'packages' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'packages' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'plan_type' values.
- **Stored Values / Dropdown Options:** free, paid

■ Table: per_target_scheme_coupons [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** enum('pending','delivered','cancelled','cn_adjusted')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'per_target_scheme_coupons' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'per_target_scheme_coupons' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** pending, delivered, cancelled, cn_adjusted

■ Table: per_target_schemes [Contains 1 Dropdown Column(s)]

→ Column: product_type

- **SQL Type:** enum('all','core','winter')
- **What is it?** System categorical configuration field defining the 'product_type' setting for the 'per_target_schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'per_target_schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'product_type' values.
- **Stored Values / Dropdown Options:** all, core, winter

■ Table: permission [Contains 1 Dropdown Column(s)]

→ **Column: status**

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'status' setting for the 'permission' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'permission' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1

■ **Table: products [Contains 1 Dropdown Column(s)]**→ **Column: status**

- **SQL Type:** tinyint
- **What is it?** 1:active,0:inactive. System categorical configuration field defining the 'status' setting for the 'products' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'products' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** -

■ **Table: purchase_targets [Contains 1 Dropdown Column(s)]**→ **Column: category_wise_target**

- **SQL Type:** json
- **What is it?** System categorical configuration field defining the 'category_wise_target' setting for the 'purchase_targets' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'purchase_targets' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_wise_target' values.
- **Stored Values / Dropdown Options:** {"8": 0, "9": 0, "10": 0, "11": 0, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 0, "18": 0, "19": 0, "20": 0, "21": 0, "22": 0, "23": 0, "24": 0, "25": 0, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 4, "9": 3, "10": 9, "11": 0, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 0, "18": 0, "19": 0, "20": 0, "21": 0, "22": 0, "23": 0, "24": 5, "25": 0, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 7, "9": 8, "10": 13, "11": 8, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 5, "18": 4, "19": 4, "20": 0, "21": 5, "22": 0, "23": 0, "24": 6, "25": 2, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 9, "9": 9, "10": 17, "11": 1, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 26, "18": 12, "19": 25, "20": 2, "21": 5, "22": 0, "23": 0, "24": 4, "25": 4, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 0, "9": 8, "10": 11, "11": 0, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 35, "18": 24, "19": 56, "20": 1, "21": 0, "22": 0, "23": 0, "24": 51, "25": 0, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 15, "9": 15, "10": 18, "11": 1, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 3, "18": 3, "19": 2, "20": 0, "21": 4, "22": 0, "23": 0, "24": 3, "25": 2, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 6, "9": 5, "10": 16, "11": 2, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 35, "18": 30, "19": 31, "20": 2, "21": 1, "22": 0, "23": 0, "24": 12, "25": 8, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 3, "9": 5, "10": 2, "11": 0, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 1, "18": 1, "19": 2, "20": 0, "21": 3, "22": 0, "23": 0, "24": 2, "25": 2, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}, {"8": 11, "9": 3, "10": 4, "11": 1, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 38, "18": 17, "19": 25, "20": 2, "21": 6, "22": 0, "23": 0, "24": 2, "25": 1, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0}

0, "29": 0, "30": 0}, {"8": 17, "9": 18, "10": 16, "11": 0, "12": 0, "13": 0, "14": 0, "15": 0, "16": 0, "17": 33, "18": 37, "19": 51, "20": 2, "21": 24, "22": 0, "23": 0, "24": 25, "25": 21, "26": 0, "27": 0, "28": 0, "29": 0, "30": 0} ... (and more)

■ Table: referral_details [Contains 2 Dropdown Column(s)]

→ Column: referral_type

- **SQL Type:** varchar(50)
- **What is it?** System categorical configuration field defining the 'referral_type' setting for the 'referral_details' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'referral_details' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'referral_type' values.
- **Stored Values / Dropdown Options:** created_by_lead

→ Column: user_role

- **SQL Type:** int unsigned
- **What is it?** System categorical configuration field defining the 'user_role' setting for the 'referral_details' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'referral_details' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_role' values.
- **Stored Values / Dropdown Options:** 2, 4, 6, 5

■ Table: repository_documents [Contains 1 Dropdown Column(s)]

→ Column: app_type

- **SQL Type:** enum('all','SE','Retailer','Distributor')
- **What is it?** System categorical configuration field defining the 'app_type' setting for the 'repository_documents' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'repository_documents' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'app_type' values.
- **Stored Values / Dropdown Options:** all, SE, Retailer, Distributor

■ Table: retailer_bulk_requests [Contains 2 Dropdown Column(s)]

→ Column: report_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'report_type' setting for the 'retailer_bulk_requests' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'retailer_bulk_requests' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'report_type' values.
- **Stored Values / Dropdown Options:** qr_list_master_report, retailer_list, cash_redemption_report, retailer_scan_count_report, retailer_scan_report, retailer_scan_reports, retailer_scan_count, retailer_scan_master_report, scanned_distributor_list, retailer_consolidated_report ... (and more)

→ Column: status

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'status' setting for the 'retailer_bulk_requests' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'retailer_bulk_requests' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** completed, pending

■ Table: retailer_category_qualified [Contains 1 Dropdown Column(s)]

→ Column: category_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'category_id' setting for the 'retailer_category_qualified' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'retailer_category_qualified' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_id' values.
- **Stored Values / Dropdown Options:** 362, 369, 371, 464, 465, 467, 468, 469, 471, 470 ... (and more)

■ Table: retailer_credit_notes [Contains 2 Dropdown Column(s)]

→ Column: business_type

- **SQL Type:** varchar(255)
- **What is it?** Wholesaler, Retailer. System categorical configuration field defining the 'business_type' setting for the 'retailer_credit_notes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'retailer_credit_notes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'business_type' values.
- **Stored Values / Dropdown Options:** wholesaler, retailer

→ Column: status

- **SQL Type:** tinyint(1)

- **What is it?** 1: Approved, 0: Not Approved. System categorical configuration field defining the 'status' setting for the 'retailer_credit_notes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'retailer_credit_notes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1

■ Table: retailer_schemes_mapping [Contains 1 Dropdown Column(s)]

→ Column: enrollment_status

- **SQL Type:** tinyint
- **What is it?** 0:pending, 1:active, 2:inactive. System categorical configuration field defining the 'enrollment_status' setting for the 'retailer_schemes_mapping' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'retailer_schemes_mapping' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'enrollment_status' values.
- **Stored Values / Dropdown Options:** 1, 2

■ Table: role_conversion_histories [Contains 2 Dropdown Column(s)]

→ Column: new_role

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'new_role' setting for the 'role_conversion_histories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'role_conversion_histories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'new_role' values.
- **Stored Values / Dropdown Options:** 2, 5

→ Column: old_role

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'old_role' setting for the 'role_conversion_histories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'role_conversion_histories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'old_role' values.
- **Stored Values / Dropdown Options:** 5, 2

■ Table: role_permission_module [Contains 1 Dropdown Column(s)]

→ Column: role_id

- **SQL Type:** int
- **What is it?** System categorical configuration field defining the 'role_id' setting for the 'role_permission_module' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'role_permission_module' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'role_id' values.
- **Stored Values / Dropdown Options:** 1, 3, 7, 9, 10, 11, 13, 14

■ Table: scanned_qrcode_history [Contains 2 Dropdown Column(s)]

→ Column: status

- **SQL Type:** int
- **What is it?** System categorical configuration field defining the 'status' setting for the 'scanned_qrcode_history' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scanned_qrcode_history' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 4, 13, 3, 14, 15, 9, 2, 5, 19, 20 ... (and more)

→ Column: type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'type' setting for the 'scanned_qrcode_history' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scanned_qrcode_history' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** bulk_scan, regular, manual

■ Table: scheme_gift_items [Contains 1 Dropdown Column(s)]

→ Column: gift_category_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'gift_category_id' setting for the 'scheme_gift_items' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scheme_gift_items' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gift_category_id' values.
- **Stored Values / Dropdown Options:** 12, 13, 15, 18

■ Table: scheme_gift_orders [Contains 2 Dropdown Column(s)]

→ Column: assigned_type

- **SQL Type:** tinyint
- **What is it?** 0-> distributor , 1->other. System categorical configuration field defining the 'assigned_type' setting for the 'scheme_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scheme_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'assigned_type' values.
- **Stored Values / Dropdown Options:** 0

→ Column: status

- **SQL Type:** enum('Pending','Processing','Delivered','Cancelled','Closed','CN adjusted')
- **What is it?** order status. System categorical configuration field defining the 'status' setting for the 'scheme_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scheme_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** Pending, Processing, Delivered, Cancelled, Closed, CN adjusted

■ Table: scheme_orders [Contains 1 Dropdown Column(s)]

→ Column: order_status

- **SQL Type:** tinyint
- **What is it?** 0:Pending, 1:Approved, 2:Rejected, 3:Completed, 4:Cancelled. System categorical configuration field defining the 'order_status' setting for the 'scheme_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scheme_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_status' values.
- **Stored Values / Dropdown Options:** 0

■ Table: scheme_wallet_transactions [Contains 2 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('sku_scan','scheme_gift_order','incentive','cash_convert','credit_note','topup')
- **What is it?** System categorical configuration field defining the 'reference_type' setting for the 'scheme_wallet_transactions' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scheme_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'reference_type' values.
- **Stored Values / Dropdown Options:** sku_scan, scheme_gift_order, incentive, cash_convert, credit_note, topup

→ Column: transaction_type

- **SQL Type:** tinyint(1)
- **What is it?** 0:debit,1:credit. System categorical configuration field defining the 'transaction_type' setting for the 'scheme_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'scheme_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_type' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: schemes [Contains 4 Dropdown Column(s)]

→ Column: point_type

- **SQL Type:** enum('box_value','cash_value')
- **What is it?** System categorical configuration field defining the 'point_type' setting for the 'schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'point_type' values.
- **Stored Values / Dropdown Options:** box_value, cash_value

→ Column: scan_type

- **SQL Type:** tinyint
- **What is it?** 1->cash_point scan, 2->gift_scan , 3->winter_scan,4->scheme_scan. System categorical configuration field defining the 'scan_type' setting for the 'schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'scan_type' values.
- **Stored Values / Dropdown Options:** 4

→ Column: scheme_type

- **SQL Type:** enum('autoEnroll','manualEnroll')
- **What is it?** System categorical configuration field defining the 'scheme_type' setting for the 'schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'scheme_type' values.
- **Stored Values / Dropdown Options:** autoEnroll, manualEnroll

→ Column: user_type

- **SQL Type:** enum('retailer','wholesaler','both')
- **What is it?** System categorical configuration field defining the 'user_type' setting for the 'schemes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'schemes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_type' values.
- **Stored Values / Dropdown Options:** retailer, wholesaler, both

■ Table: se_reports [Contains 2 Dropdown Column(s)]**→ Column: report_name**

- **SQL Type:** enum('new_retailers','new_category')
- **What is it?** System categorical configuration field defining the 'report_name' setting for the 'se_reports' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'se_reports' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'report_name' values.
- **Stored Values / Dropdown Options:** new_retailers, new_category

→ Column: status

- **SQL Type:** tinyint unsigned
- **What is it?** 0:pending,1:processing, 2:completed, 3:failed. System categorical configuration field defining the 'status' setting for the 'se_reports' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'se_reports' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 2

■ Table: se_task [Contains 1 Dropdown Column(s)]**→ Column: status**

- **SQL Type:** varchar(255)
- **What is it?** 1=pending,2=reschedule,3=completed,4=failed,5=cancelled. System categorical configuration field defining the 'status' setting for the 'se_task' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'se_task' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 4, 3

■ Table: se_task_history [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** varchar(255)
- **What is it?** pending, reschedule, completed, failed, cancelled. System categorical configuration field defining the 'status' setting for the 'se_task_history' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'se_task_history' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 2, 3, 4

■ Table: shop_verification_images [Contains 1 Dropdown Column(s)]

→ Column: user_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'user_type' setting for the 'shop_verification_images' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'shop_verification_images' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'user_type' values.
- **Stored Values / Dropdown Options:** distributor, retailer, wholeseller

■ Table: sku_bulk_imports [Contains 1 Dropdown Column(s)]

→ Column: Source

- **SQL Type:** tinyint(1)
- **What is it?** 1:kolkata, 0:Tirupur. System categorical configuration field defining the 'Source' setting for the 'sku_bulk_imports' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_bulk_imports' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'Source' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: sku_inventories [Contains 4 Dropdown Column(s)]

→ Column: order_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'order_type' setting for the 'sku_inventories' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_inventories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'order_type' values.
- **Stored Values / Dropdown Options:** Distributor

→ Column: sources

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'sources' setting for the 'sku_inventories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_inventories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'sources' values.
- **Stored Values / Dropdown Options:** tirupur, kolkata

→ Column: status_retailer_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'status_retailer_id' setting for the 'sku_inventories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_inventories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status_retailer_id' values.
- **Stored Values / Dropdown Options:** 57302, 75649, 53595, 60728, 51234, 66502, 78564, 60422, 54773, 50503 ... (and more)

→ Column: status_wholeseller_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'status_wholeseller_id' setting for the 'sku_inventories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_inventories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status_wholeseller_id' values.
- **Stored Values / Dropdown Options:** 50224, 51321, 48700

■ Table: sku_products [Contains 2 Dropdown Column(s)]

→ Column: category_sub_group_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'category_sub_group_id' setting for the 'sku_products' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_products' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'category_sub_group_id' values.
- **Stored Values / Dropdown Options:** 1, 2, 3, 7, 5, 44, 45, 46, 15, 47 ... (and more)

→ Column: season

- **SQL Type:** enum('winter','summer','rainy','core')
- **What is it?** System categorical configuration field defining the 'season' setting for the 'sku_products' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_products' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'season' values.
- **Stored Values / Dropdown Options:** winter, summer, rainy, core

■ Table: sku_qr_points_maps [Contains 1 Dropdown Column(s)]**→ Column: gride_type**

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'gride_type' setting for the 'sku_qr_points_maps' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sku_qr_points_maps' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gride_type' values.
- **Stored Values / Dropdown Options:** FG_BIG, FG_SMALL

■ Table: state [Contains 1 Dropdown Column(s)]**→ Column: jgh_magic_status**

- **SQL Type:** tinyint(1)
- **What is it?** 1:Active, 0:Inactive. System categorical configuration field defining the 'jgh_magic_status' setting for the 'state' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'state' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'jgh_magic_status' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: suppliers [Contains 1 Dropdown Column(s)]**→ Column: type**

- **SQL Type:** tinyint
- **What is it?** 1=Travel Agent, 2=Online Partner, 3=Agency. System categorical configuration field defining the 'type' setting for the 'suppliers' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'suppliers' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** -

■ Table: survey_forms [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** tinyint(1)
- **What is it?** 1:Active, 0:Inactive. System categorical configuration field defining the 'status' setting for the 'survey_forms' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'survey_forms' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** -

■ Table: sync_tripur_data [Contains 2 Dropdown Column(s)]

→ Column: source

- **SQL Type:** varchar(20)
- **What is it?** System categorical configuration field defining the 'source' setting for the 'sync_tripur_data' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sync_tripur_data' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'source' values.
- **Stored Values / Dropdown Options:** tirupur, kolkata

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 0=pending, 1=processing,2=qr_generated,3=qr_processing,4=processed. System categorical configuration field defining the 'status' setting for the 'sync_tripur_data' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'sync_tripur_data' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 4, 29, 1

■ Table: table_qr_pdfs [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** int
- **What is it?** System categorical configuration field defining the 'status' setting for the 'table_qr_pdfs' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'table_qr_pdfs' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1

■ Table: tds_certificates [Contains 1 Dropdown Column(s)]**→ Column: business_type**

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'business_type' setting for the 'tds_certificates' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'tds_certificates' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'business_type' values.
- **Stored Values / Dropdown Options:** Retailer, Wholesaler

■ Table: tripur_api_tokens [Contains 1 Dropdown Column(s)]**→ Column: token_type**

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'token_type' setting for the 'tripur_api_tokens' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'tripur_api_tokens' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'token_type' values.
- **Stored Values / Dropdown Options:** Bearer

■ Table: user_geotag_photos [Contains 1 Dropdown Column(s)]**→ Column: approval_status**

- **SQL Type:** tinyint(1)
- **What is it?** 0: Pending, 1: Approved, 2: Rejected. System categorical configuration field defining the 'approval_status' setting for the 'user_geotag_photos' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'user_geotag_photos' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'approval_status' values.
- **Stored Values / Dropdown Options:** 0, 1, 2

■ Table: user_scan_permissions [Contains 1 Dropdown Column(s)]

→ Column: status

- **SQL Type:** tinyint(1)
- **What is it?** 1:Block, 0:Unblock. System categorical configuration field defining the 'status' setting for the 'user_scan_permissions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'user_scan_permissions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: user_withdrawal_block_histories [Contains 2 Dropdown Column(s)]

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 0:unblock,1:blocked. System categorical configuration field defining the 'status' setting for the 'user_withdrawal_block_histories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'user_withdrawal_block_histories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1, 0

→ Column: withdrawal_type

- **SQL Type:** enum('cash','gift_redeem')
- **What is it?** System categorical configuration field defining the 'withdrawal_type' setting for the 'user_withdrawal_block_histories' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'user_withdrawal_block_histories' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'withdrawal_type' values.
- **Stored Values / Dropdown Options:** cash, gift_redeem

■ Table: users [Contains 5 Dropdown Column(s)]

→ Column: account_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'account_type' setting for the 'users' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'users' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'account_type' values.
- **Stored Values / Dropdown Options:** Savings, Current

→ Column: bank_details_status

- **SQL Type:** tinyint
- **What is it?** 0=bank data not present,1= bank data present. System categorical configuration field defining the 'bank_details_status' setting for the 'users' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'users' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'bank_details_status' values.
- **Stored Values / Dropdown Options:** 1, 0

→ Column: kyc_status

- **SQL Type:** int
- **What is it?** User Identity & Document Verification State
- **Where does it come from? (Trigger):** Set by automated KYC validation engines (Aadhaar/PAN API) or manual admin overrides.
- **What is its use / Business Value?** Enforces tax compliance and identity verification.
- **Individual Value Options Breakdown:**

→ Value: 0 (Unverified)

What is it? KYC process has not been completed or started.

Where does it come from? Default status for newly created accounts.

What is its use? Blocks the user from requesting cash withdrawals to comply with tax guidelines.

→ Value: 1 (Verified)

What is it? User's Aadhaar and PAN documents verified as authentic.

Where does it come from? Digio verification callback or manual admin verification.

What is its use? Enables the cash withdrawal feature in the user's mobile wallet.

→ Value: 2 (Rejected)

What is it? Aadhaar/PAN verification failed due to document mismatches.

Where does it come from? KYC API verification failure.

What is its use? Restricts withdrawals and flags the account for document correction.

→ Column: status

- **SQL Type:** varchar(255)
- **What is it?** User Account Access Status
- **Where does it come from? (Trigger):** Set manually by Business/Super Admins on the dashboard panel.
- **What is its use / Business Value?** Enforces platform security and KYC validation checks.
- **Individual Value Options Breakdown:**

→ Value: pending

What is it? User profile is registered but has not been verified by an admin.

Where does it come from? Automatically assigned during user self-onboarding in the mobile app.

What is its use? Allows the user to log in but restricts them from scanning QR codes or withdrawing cash until approved.

→ **Value: approved**

What is it? User profile verified and authenticated.

Where does it come from? Dashboard action by a Super Admin after reviewing user documents.

What is its use? Unlocks full access to loyalty scans, target schemes, and points withdrawals.

→ **Value: rejected**

What is it? User onboarding application failed validation (e.g. incorrect PAN, fake store name).

Where does it come from? Dashboard rejection action by an Admin.

What is its use? Suspends account features and prompts the user to re-upload clear profile information.

→ **Column: user_role**

- **SQL Type:** int
- **What is it?** System Access Level
- **Where does it come from? (Trigger):** Set during registration or modified by Admins. Maps to role.id.
- **What is its use / Business Value?** Controls menu visibility and points distribution structures.
- **Individual Value Options Breakdown:**

→ **Value: 1 (Business Admin)**

What is it? Company-level admin with dashboard access.

Where does it come from? Admin panel creation.

What is its use? Manages regional SKU mappings and scheme distributions.

→ **Value: 2 (Retailer)**

What is it? Retailer outlet scanner account.

Where does it come from? User registration selections.

What is its use? Assigned retailer cash points for scanning SKUs.

→ **Value: 4 (Distributor)**

What is it? Distributor supply chain account.

Where does it come from? Distributor onboarding portal.

What is its use? Authorized to manage billing and Credit Note settlements.

→ **Value: 5 (Wholesaler)**

What is it? Wholesaler scanner account.

Where does it come from? User registration selections.

What is its use? Assigned wholesaler cash points for scanning SKUs.

■ Table: vendor_element_state_mappings [Contains 1 Dropdown Column(s)]

→ **Column: status**

- **SQL Type:** tinyint
- **What is it?** 1=active, 0=inactive. System categorical configuration field defining the 'status' setting for the 'vendor_element_state_mappings' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'vendor_element_state_mappings' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.

- **Stored Values / Dropdown Options:** -

■ Table: vendors [Contains 2 Dropdown Column(s)]

→ Column: gender

- **SQL Type:** enum('male','female','other')
- **What is it?** System categorical configuration field defining the 'gender' setting for the 'vendors' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'vendors' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gender' values.
- **Stored Values / Dropdown Options:** male, female, other

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 1=active, 0=inactive. System categorical configuration field defining the 'status' setting for the 'vendors' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'vendors' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: video_responses [Contains 1 Dropdown Column(s)]

→ Column: response

- **SQL Type:** enum('interested','se_visit','call_back')
- **What is it?** System categorical configuration field defining the 'response' setting for the 'video_responses' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'video_responses' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'response' values.
- **Stored Values / Dropdown Options:** interested, se_visit, call_back

■ Table: visit_check_in_check_out [Contains 1 Dropdown Column(s)]

→ Column: visit_type

- **SQL Type:** varchar(255)
- **What is it?** System categorical configuration field defining the 'visit_type' setting for the 'visit_check_in_check_out' records.

- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'visit_check_in_check_out' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'visit_type' values.
- **Stored Values / Dropdown Options:** ORDER RECEIVED, yes, 2, owner not present, Dinesh Kumar, visit complete, Non stop Collection, visit, Vipul Redaymead, aggarwal collection ... (and more)

■ Table: wallet_transaction [Contains 3 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('cash_point','withdrawal','topup','bonus_conversion','referral_earning','returned','coupon_redeem','credit_note','incentive','spin','target_scheme_coupon')
- **What is it?** Wallet Points Credit/Debit Source Category
- **Where does it come from? (Trigger):** Written by the ledger service whenever points are adjusted. Triggers include QR scans, payout approvals, or admin balance overrides.
- **What is its use / Business Value?** Tracks the source of wallet balance adjustments (e.g. cash_point, withdrawal, topup, bonus_conversion, credit_note).
- **Individual Value Options Breakdown:**

→ Value: cash_point

What is it? QR Code Scan Reward: Retailer scanned a barcode box.

Where does it come from? Successful QR scan validation.

What is its use? Points credited to retailer wallet balance (linked to mypoints.id).

→ Value: withdrawal

What is it? Cash Out Payout: User redeemed wallet points for bank account cash.

Where does it come from? User submits withdrawal form in app.

What is its use? Deducts cash amount from wallet balance (linked to withdrawal_request.id).

→ Value: topup

What is it? Manual Adjustment: Admin manually adds/adjusts user points.

Where does it come from? Admin panel point override forms.

What is its use? Direct wallet credit (reference_id is NULL).

→ Value: bonus_conversion

What is it? Cash-to-Bonus Conversion: Cash points converted into gift shop points.

Where does it come from? User selects conversion in app profile.

What is its use? Deducts cash balance and credits gift points (linked to bonus_transactions.id).

→ Value: referral_earning

What is it? Referral Reward: Referrer earned points from a referred user.

Where does it come from? Invite referral system logs.

What is its use? Credits points to referrer wallet balance (reference_id is NULL).

→ Value: credit_note

What is it? Credit Note Settlement: Payout adjusted directly with distributor.

Where does it come from? Distributor billing settlement actions.

What is its use? Deducts settled credit note value from wallet (linked to retailer_credit_notes.id).

→ **Value: incentive**

What is it? Campaign Target Points: Awarded for hitting growth target schemes.

Where does it come from? Weekly/monthly target checks.

What is its use? Credits campaign scheme bonus to wallet (linked to incentive_schemes.id).

→ **Column: status**

- **SQL Type:** tinyint(1)
- **What is it?** Wallet Points Ledger Transaction Status
- **Where does it come from? (Trigger):** Logged by database triggers on QR scan completes or payout requests.
- **What is its use / Business Value?** Represents the validation stage of the financial point entry.
- **Individual Value Options Breakdown:**

→ **Value: 0 (pending)**

What is it? Points entry initiated but awaiting system validation or admin approval.

Where does it come from? Ledger initiation trigger.

What is its use? Temporarily reserves the points, preventing balance inflation before verification completes.

→ **Value: 1 (success)**

What is it? Points entry verified and completed.

Where does it come from? Successful QR validation webhook or approved payout.

What is its use? Increments or decrements the user's active wallet balance (wallet_balance) permanently.

→ **Value: 2 (failed)**

What is it? Points entry rejected or cancelled.

Where does it come from? QR validation rejection or payout request cancellation.

What is its use? Invalidates the points transaction, preventing any balance changes.

→ **Column: transaction_type**

- **SQL Type:** tinyint(1)
- **What is it?** 0:Debit,1:Credit. System categorical configuration field defining the 'transaction_type' setting for the 'wallet_transaction' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'wallet_transaction' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_type' values.
- **Stored Values / Dropdown Options:** 1, 0

■ Table: weekly_scheme_prizes [Contains 1 Dropdown Column(s)]

→ **Column: type**

- **SQL Type:** enum('cash','gift','bonus')
- **What is it?** System categorical configuration field defining the 'type' setting for the 'weekly_scheme_prizes' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'weekly_scheme_prizes' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.

- **Stored Values / Dropdown Options:** cash, gift, bonus

■ Table: wholesale_wallet_transactions [Contains 3 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('sku_scan','credit_note','cash_withdrawal')
- **What is it?** System categorical configuration field defining the 'reference_type' setting for the 'wholesale_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'wholesale_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'reference_type' values.
- **Stored Values / Dropdown Options:** sku_scan, credit_note, cash_withdrawal

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 0:pending, 1:success, 2:failed. System categorical configuration field defining the 'status' setting for the 'wholesale_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'wholesale_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 1

→ Column: transaction_type

- **SQL Type:** tinyint(1)
- **What is it?** 0:debit, 1:credit. System categorical configuration field defining the 'transaction_type' setting for the 'wholesale_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'wholesale_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_type' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: winter_gift_items [Contains 2 Dropdown Column(s)]

→ Column: gift_category_id

- **SQL Type:** bigint unsigned
- **What is it?** System categorical configuration field defining the 'gift_category_id' setting for the 'winter_gift_items' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'winter_gift_items' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'gift_category_id' values.

- **Stored Values / Dropdown Options:** 12, 14, 15, 18

→ Column: status

- **SQL Type:** tinyint
- **What is it?** 0:inactive,1:active. System categorical configuration field defining the 'status' setting for the 'winter_gift_items' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'winter_gift_items' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** 0

■ Table: winter_gift_orders [Contains 2 Dropdown Column(s)]

→ Column: assigned_type

- **SQL Type:** tinyint
- **What is it?** 0-> distributor , 1->other. System categorical configuration field defining the 'assigned_type' setting for the 'winter_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'winter_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'assigned_type' values.
- **Stored Values / Dropdown Options:** -

→ Column: status

- **SQL Type:** enum('Pending','Processing','Delivered','Cancelled','Closed','CN adjusted')
- **What is it?** System categorical configuration field defining the 'status' setting for the 'winter_gift_orders' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'winter_gift_orders' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'status' values.
- **Stored Values / Dropdown Options:** Pending, Processing, Delivered, Cancelled, Closed, CN adjusted

■ Table: winter_scan_wallet_transactions [Contains 2 Dropdown Column(s)]

→ Column: reference_type

- **SQL Type:** enum('sku_scan','gift_order','cash_withdrawal','topup','credit_note')
- **What is it?** System categorical configuration field defining the 'reference_type' setting for the 'winter_scan_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'winter_scan_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'reference_type' values.
- **Stored Values / Dropdown Options:** sku_scan, gift_order, cash_withdrawal, topup, credit_note

→ Column: transaction_type

- **SQL Type:** tinyint
- **What is it?** 0:debit,1:credit. System categorical configuration field defining the 'transaction_type' setting for the 'winter_scan_wallet_transactions' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'winter_scan_wallet_transactions' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'transaction_type' values.
- **Stored Values / Dropdown Options:** 0, 1

■ Table: wishlists [Contains 1 Dropdown Column(s)]

→ Column: type

- **SQL Type:** enum('gift_card','scheme_gift_card','winter_gift_card')
- **What is it?** System categorical configuration field defining the 'type' setting for the 'wishlists' records.
- **Where does it come from? (Trigger):** Set during record creation or updated during status updates in the 'wishlists' module.
- **What is its use / Business Value?** Used to track and filter table rows based on their 'type' values.
- **Stored Values / Dropdown Options:** gift_card, scheme_gift_card, winter_gift_card

■ Table: withdrawal_request [Contains 2 Dropdown Column(s)]

→ Column: status

- **SQL Type:** tinyint(1)
- **What is it?** Cash Withdrawal Workflow State
- **Where does it come from? (Trigger):** Initiated by the user and processed by dashboard administrators.
- **What is its use / Business Value?** Controls the validation and release of cash payouts.
- **Individual Value Options Breakdown:**

→ Value: 0 (pending)

What is it? Withdrawal requested by the user and queued for accountant review.

Where does it come from? User submits a payout form in the mobile wallet.

What is its use? Appears on the dashboard payout queue for approval.

→ Value: 1 (approved)

What is it? Withdrawal request authorized and bank transfer completed.

Where does it come from? Accountant clicks 'Approve' on the dashboard, triggering the payout API.

What is its use? Confirms the funds have been successfully routed to the bank.

→ Value: 2 (Reject)

What is it? Withdrawal request refused.

Where does it come from? Dashboard rejection action by an Admin (e.g. incorrect bank account details).

What is its use? Reverses the points back to the user's active wallet balance and notifies them.

→ Column: withdraw_request_type

- **SQL Type:** varchar(50)
- **What is it?** Requested Payout Routing Method
- **Where does it come from? (Trigger):** Chosen by the user in the mobile wallet payout screen.
- **What is its use / Business Value?** Directs how the payout API payload should be compiled.
- **Individual Value Options Breakdown:**

→ Value: bank

What is it? Transfer directly to the user's checking/savings bank account.

Where does it come from? User inputs account number and IFSC code.

What is its use? Routes transaction through bank API (IMPS/NEFT).

→ Value: upi

What is it? Transfer to the user's UPI handle.

Where does it come from? User inputs Virtual Payment Address (VPA).

What is its use? Routes transaction through UPI payout endpoints.
